

Tyrone Forage Soybean

Tyrone forage soybean brings out the potential in your deer and cattle herd. The full season soybean has a “1-2 punch” of protein and biomass.

- Maturity group 7 forage soybean that matures much later than conventional Ag soybeans.
- An indeterminate variety that was selected for its height and bushy characteristics. The indeterminate nature allows it to keep growing later and tolerate browsing better than Ag type soybeans.
- Can reach heights up to 7 feet tall.
- Can be used for grazing, hay, or silage over a wide geographic area of the United States. Tyrone's are superior in forage production compared to short, conventional grain-type soybean plants that are not well suited for high forage yields.
- Its disease package makes it resistant to certain common soybean diseases such as Phytophthora.
- Well suited for dairy and cattle forage where herbicide use is an utmost consideration. A great conventional forage soybean that will add dollars to your bottom line.

USDA Soybean breeder, Dr. Tom Devine, developed the Tyrone forage soybean variety. It was a culmination of 19 years of work to develop the superior forage soybean.

Tyrone forage soybeans provide protein for antler development.

Tyrone forage soybeans can withstand heavy deer browsing.

Tyrone: An excellent grain yielder. Soybean farmers have had good success growing Tyrone forage soybeans for grain where heavy deer browsing can be a problem.

Standing room only.
